    What does a neuron compute?

    A neuron computes the mean of all features before applying the output to an activation function

    A neuron computes a function g that scales the input x linearly (Wx + b)

     A neuron computes an activation function followed by a linear function (z = Wx + b)

    A neuron computes a linear function (z = Wx + b) followed by an activation function

                                                                                                                      1 point
2. Which of these is the "Logistic Loss"?
    igcup \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} - \hat{y}^{(i)} \mid^2
    igotimes \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1-y^{(i)})\log(1-\hat{y}^{(i)}))
    igcup \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = max(0,y^{(i)}-\hat{y}^{(i)})
    igcup \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} - \hat{y}^{(i)} \mid
3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How
                                                                                                                      1 point
    do you reshape this into a column vector?
    x = img.reshape((32*32,3))
    x = img.reshape((32*32*3,1))
     x = img.reshape((3,32*32))
     x = img.reshape((1,32*32,*3))
                                                                                                                      1 point
Consider the two following random arrays "a" and "b":
         1 a = np.random.randn(2, 3) # a.shape = (2, 3)
         b = np.random.randn(2, 1) # b.shape = (2, 1)
        3 c = a + b
     What will be the shape of "c"?
     The computation cannot happen because the sizes don't match. It's going to be "Error"!
    c.shape = (2, 1)
     c.shape = (3, 2)
    c.shape = (2, 3)
 5. Consider the two following random arrays "a" and "b":
                                                                                                                      1 point
        1 a = np.random.randn(4, 3) # a.shape = (4, 3)
        b = np.random.randn(3, 2) # b.shape = (3, 2)
        3 c = a*b
     What will be the shape of "c"?
     c.shape = (4,2)
     c.shape = (4, 3)
     c.shape = (3, 3)
     The computation cannot happen because the sizes don't match. It's going to be "Error"!
6. Suppose you have n_x input features per example. Recall that X=[x^{(1)}x^{(2)}...x^{(m)}]. What is the dimension
                                                                                                                    1 point
     \bigcirc (1,m)
     \bigcap (m, n_x)
     \bigcirc (m,1)
    \bigcirc (n_x, m)
7. Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-
                                                                                                                      1 point
     wise multiplication.
     Consider the two following random arrays "a" and "b":
         1 a = np.random.randn(12288, 150) # a.shape = (12288, 150)
         b = np.random.randn(150, 45) # b.shape = (150, 45)
        What is the shape of c?
    c.shape = (12288, 45)
     c.shape = (12288, 150)
     c.shape = (150,150)
     The computation cannot happen because the sizes don't match. It's going to be "Error"!
 Consider the following code snippet:
    1 # a.shape = (3,4)
         2 # b.shape = (4,1)
         4 for i in range(3):
         5 for j in range(4):
         6 c[i][j] = a[i][j] + b[j]
     How do you vectorize this?
     ○ c = a + b
     \bigcirc c = a.T + b.T
     c = a + b.T
     \bigcirc c = a.T + b
                                                                                                                      1 point
Consider the following code:
         1 a = np.random.randn(3, 3)
         b = np.random.randn(3, 1)
         3 c = a*b
    What will be c? (If you're not sure, feel free to run this in python to find out).
     ● This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise
         product so c.shape will be (3, 3)
     ○ This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix
         multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
     This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
     O It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead
         use np.dot(a,b)
Consider the following computation graph.
                                       u = a * b
                                       v = a * c
                                                                                   J = u + v - w
                                      w = b + c
     What is the output J?
```
